

It is easy to integrate pdf view option in your page at laravel. Many time you need to embed the notice or any kind of results in page in this case you need to use iframe. You don't need to redirect user to other page by using this. It's most advantage is that user can view the documents directly and can give to command for printing or downloading.

Here is the only one line code. Use the own file location at source URL

```
<iframe src="{{URL::to('/')}}/your file path here" width="100%"  
height="600"></iframe>
```

Look the example here

```
<iframe src="" width="100%" height="600"></iframe>
```
